

The E-PAK Advantage

Benefits of E-PAK Cappers

- Systems range from manual hand-held to fully automatic
- Custom built for your specific application and budget
- Easy setup with quick changeover features
- Minimal downtime for maintenance
- Robust construction--built to last
- Designed for product versatility
- Standard NEMA 4 construction
- Optional EXP controls

Common Applications

- Petroleum and automotive products
- Cosmetic & personal care products
- Household & industrial cleaners
- Bottled water & still beverages
- Acids & corrosive products
- Pharmaceutical products
- Paints, stains & sealants
- Food products & sauces
- Agricultural products
- Flammable solvents
- Molten products

E-PAK Capping Systems

Hand-Held ♦ Semi-Automatic ♦ Automatic

Spindle-Style Screw Cappers

E-PAK's Spindle Cappers provide a highly versatile solution for applying and tightening threaded caps. They are available in 3 and 4 station models. The 4 station capper offers an optional reversing feature that is effective in seating caps that might otherwise cross thread. Several cap sorting devices are available, including the vibratory bowl, sorting elevator, centrifugal sorter and pocket sorter.

Spindle-Style Cap Tighteners

E-PAK's Spindle Cap Tighteners are very durable and versatile machines that are able to torque a wide range of hand-placed threaded cap types. It is also commonly used as a retorquer after induction sealing. Offered in 2, 3 or 4 station models, these tighteners can be automated at a later time by simply adding a cap chute and sorting device. This is a great solution for those who want to begin automating their capping process and ensure consistent torques.

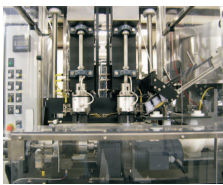

Snap Cappers

E-PAK's Automatic, Semi-Automatic and Snap Capper Completion Units are very robust and versatile machines that are able to sort and place a wide range of snap-on/press-on caps. The appropriate gripping belts guide the container securely through the completion unit where a gradual slope variable drive press-down belt snaps the caps into place. The cap completion unit, delivery chute and sorting bowl can be purchased separately or together, so you buy the components that you need now and add other items as your needs change.

Spindle / Snap Combination Cappers

E-PAK Combination Cappers are very durable and versatile machines that are able to sort, place, and complete a wide range of both screw and snap caps. The cappers feature both assemblies to apply torque and downward pressure. Sets of polyurethane discs are used to turn the caps into place and an inclined press down belt presses caps to assist completion. E-PAK Combination Cappers are typically used in operations where maximum versatility is required because both screw and snap caps must be applied. They are also used to apply unusual caps that must be both turned and pressed at the same time in order to be accurately seated.

Chuck Cappers

The E-PAK Chuck Cappers are designed to maximize the speed of your packaging line while maintaining a constant torque on your caps. The chuck picks up the cap from the chute and places it on the container and tightens. An operator can supply the chute as a semi-automatic application, or the application can be fully automated with the addition of a cap sorter. Chuck cappers are a great solution for applications that require unusually high application torques.

Hand-Held Chuck Cappers

E-PAK's Hand-Held Chuck Cappers provide a simple, cost effective solution for applying screw caps to plastic, metal and glass containers. An easy-to-set dial on the driver adjusts the torque. A wide selection of chucks are available to fit your cap size and the rubber inserts ensure that caps are applied with the chosen torque without scuffing or damaging the cap. The retractable cord assists the operator in tightening the cap more efficiently. Electric or pneumatic models are available along with a variety of optional stands to minimize operator fatigue.

Quality ♦ Value ♦ Excellence!
